# NOVELTY PROCESSING AND MEMORY IMPAIRMENT IN ALZHEIMER'S DISEASE

2

# MAIN QUESTIONS

- 1) Do patients with AD or MCI still detect novelty?
- 2) Does novelty detection improve memory as is usually the case in healthy subjects?
- 3) Is it possible to use novelty to enhance memory in AD?

unfamiliarity  
refreshing originality ornament  
modernness animating modernity innovation  
trinket gimcrack groundbreaking recently  
innovative creativeness freshly invigorating  
invention creativity creation bracing inventive  
recent creatively bauble unusualness  
toy  
gaud new fallal newly  
trifle  
conception bangle freshness  
ingenious fresh break with tradition  
difference creative gewgaw newness  
imaginativeness curiosity ingenuity unfamiliar  
knickknack innovativeness  
naturalness unconventionality  
straightforwardness

# novelty

# ABSTRACT

The detection and processing of novelty plays a critical role in memory function. Despite this, relatively little is known about how novelty influences memory in Alzheimer's disease (AD).

The studies reviewed showed that novelty processing is mostly impaired in AD patients, whereas it can be preserved under some conditions in MCI, particularly when cognitive demands are otherwise low.

# NOVELTIES:

| Term                | Definition  |
|---------------------|---|
| Stimulus novelty    | An unfamiliar stimulus or stimulus that has never been experienced before |
| Contextual novelty  | A familiar stimulus that is unexpected in a given context                 |
| Associative novelty | A novel configuration or combination of familiar stimuli                  |

# ASSESSMENT METHODS

1) Stimulus novelty detection

Visual paired comparison task

2) Contextual novelty detection

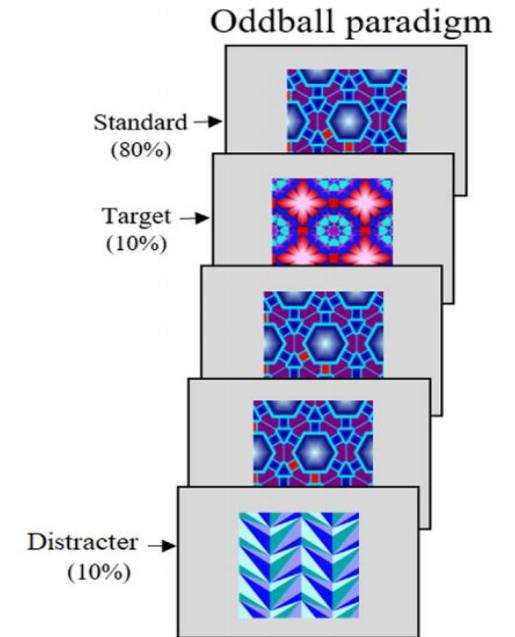

Oddball paradigm

3) Novelty-related memory effects

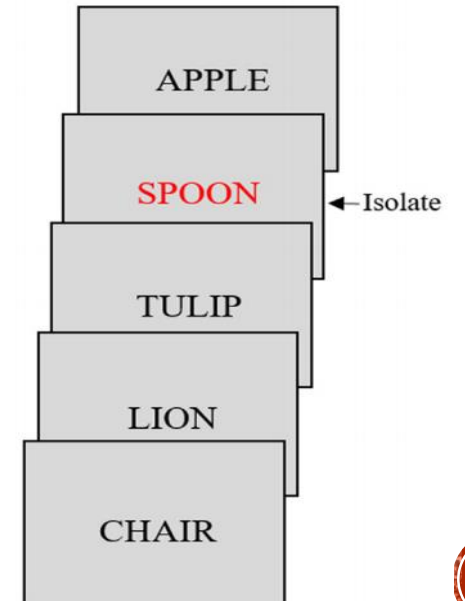

Von Restorff paradigm

Novelty system activation

Pre-experimental familiarity

von Restorff paradigm

# COGNITIVE MODELS OF NOVELTY PROCESSING AND MEMORY

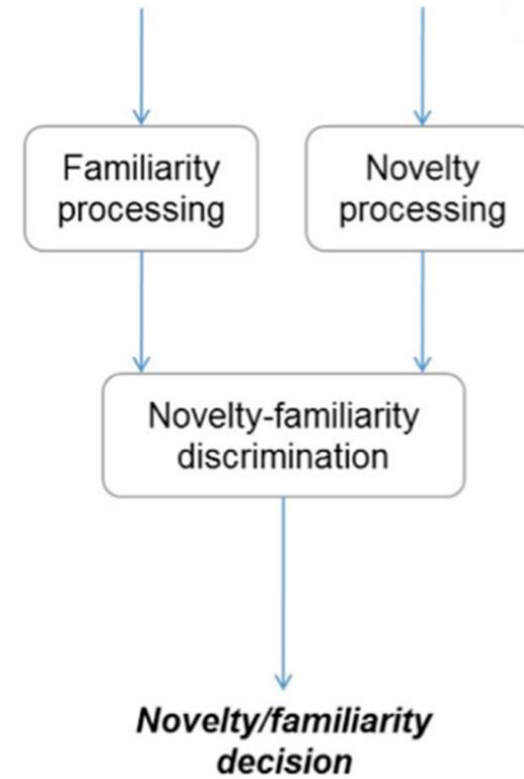

-In the case of stimulus novelty, Some models assimilate novelty detection with familiarity detection

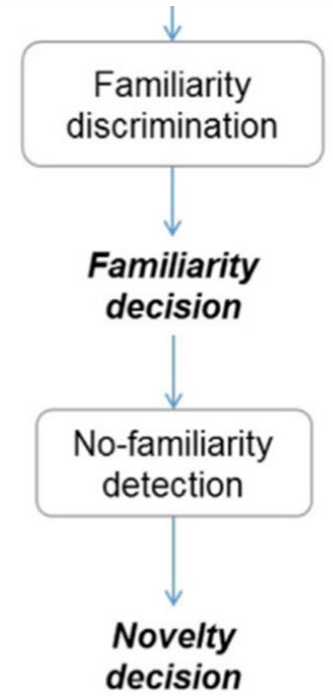

-In the case of contextual novelty, some models proposed that it relies on a comparator mechanism between prior expectations and experience

1. Single-step single-continuum model

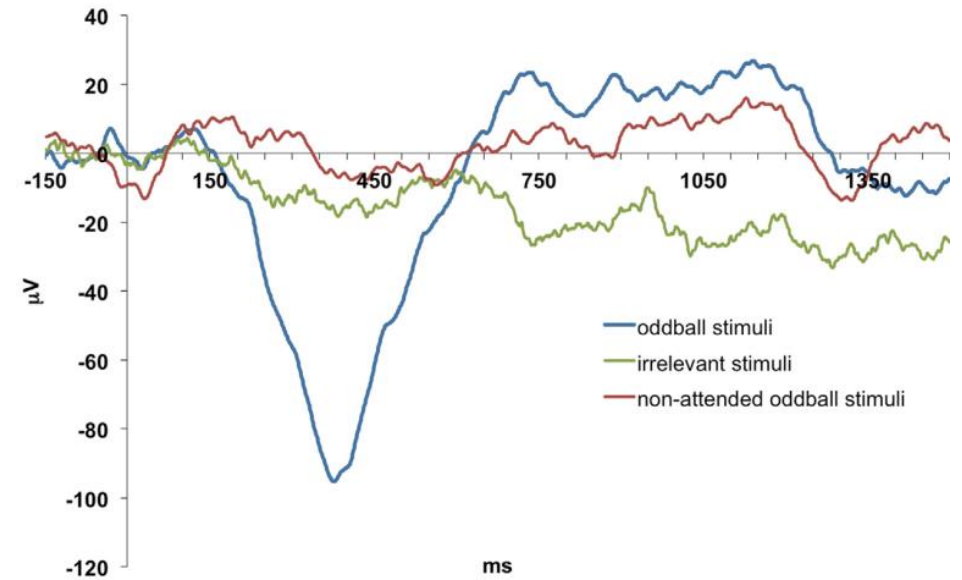

2. Dual-route with convergence model

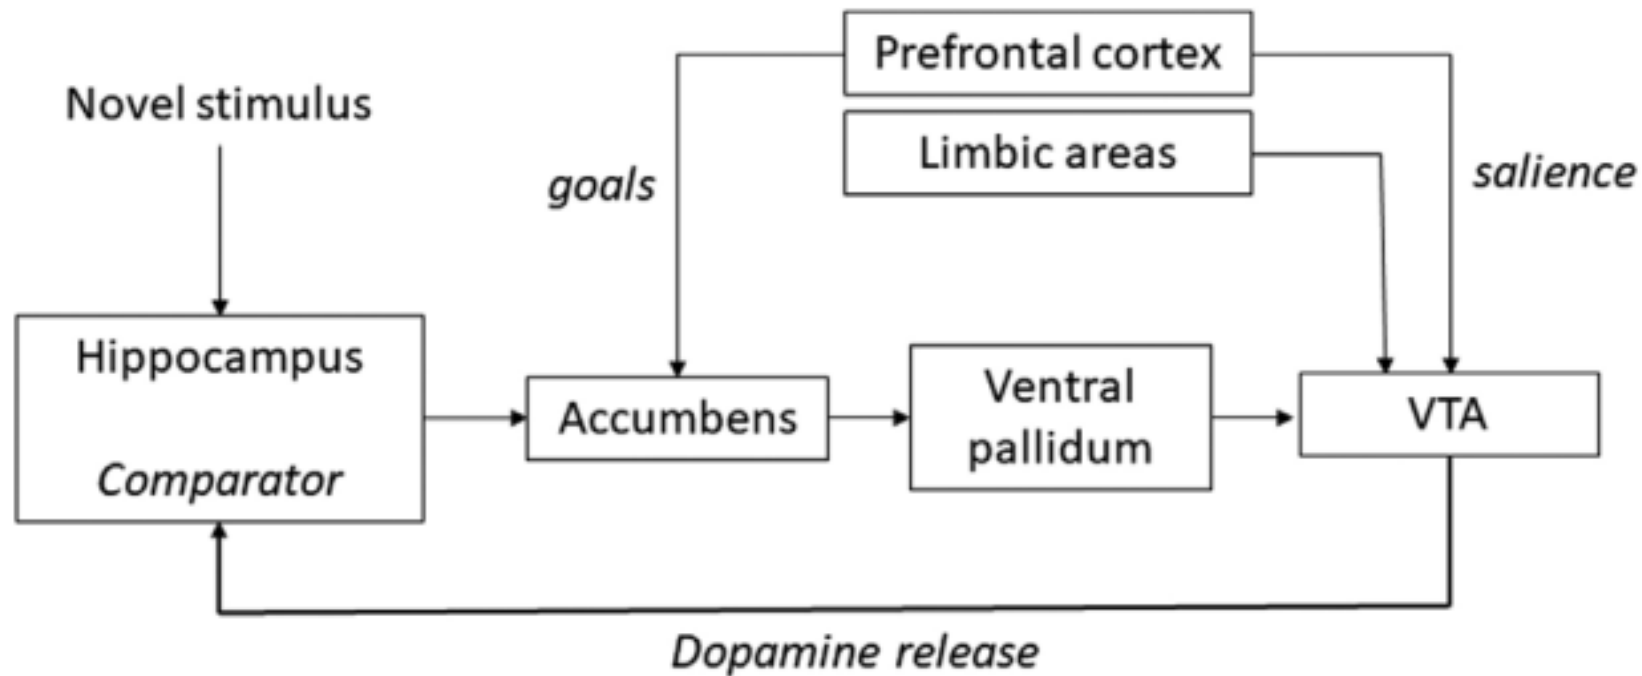

3. Two-steps model

The detection of novelty and novelty-related memory effects rely on a large-scale cerebral network, in which the hippocampus and other temporal lobe structures, the prefrontal cortex and the substantia nigra/ventral tegmental area play a crucial role.

# NEUROBIOLOGICAL MODELS OF NOVELTY PROCESSING

# NOVELTY IN ALZHEIMER'S DISEASE: IMPAIRED OR PRESERVED?

- Physiopathology of Alzheimer's disease
- Dopamine in AD
- Novelty detection in early course of Alzheimer's disease

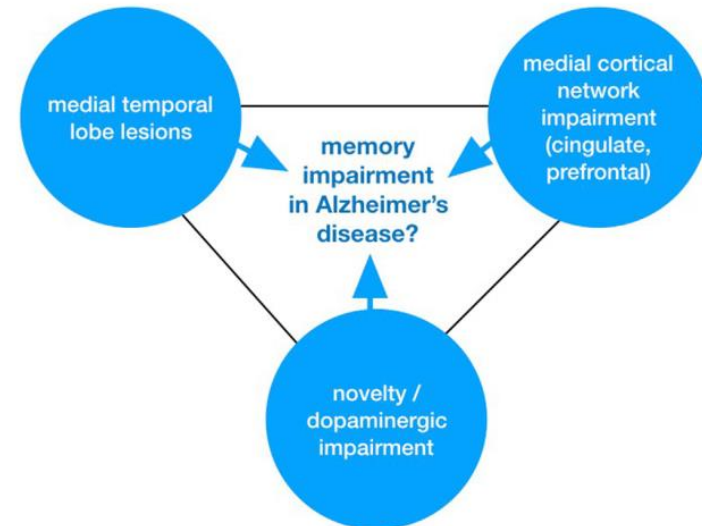

# OUTSTANDING QUESTIONS

1. Identifying the patterns of impairments across different types of novelty
2. Establishing the link between novelty and memory impairment during the time course of AD
3. Determining the clinical correlates of novelty in AD
4. Manipulating novelty to improve memory in AD

# A NOVEL MODEL OF MEMORY IMPAIRMENT IN ALZHEIMER'S DISEASE

More broadly, a possibility is that taking into account novelty might be highly beneficial to conceptualize better models of the memory impairment in AD

# THE END
