**Concepts of Biology**  
Chapter 1: Introduction to Biology

- This NASA image is a composite of several satellite-based views of Earth. To make the whole-Earth image, NASA scientists combine observations of different parts of the planet. (Credit: modification of work by NASA)

# Characteristics of Life

- Order/Complexity.
- Sensitivity/Response to Stimuli.
  - Reproduction.
  - Adaptation.
  - Evolution.

- A toad represents a highly organized structure consisting of cells, tissues, organs, and organ systems. (Credit: “Ivengo(RUS)”/Wikimedia Commons)

- This course will highlight information from the atomic level to the level of organ systems.

# Characteristics of Life

- Growth and Development.
  - Regulation.
  - Homeostasis.
- Energy Processing.

# Evolution by Natural Selection

## Facts and Inferences:

1. Organisms within a population vary.
2. Most variation is genetic.
3. More are born than can survive (some resource will be limiting).
  - a. Competition for resources.
  - b. Organisms with variations best suited to current environment survive better and leave more offspring with those variations.
4. Population gene pool changes over time (evolution).

- The leaves of this sensitive plant (*Mimosa pudica*) will instantly droop and fold when touched. After a few minutes, the plant returns to its normal state. (Credit: Alex Lomas)
  - **What survival advantage might this folding-up confer?**

# CONCEPT IN ACTION

- Watch this [video](#) to see how the sensitive plant responds to a touch stimulus.
- [http://commons.wikimedia.org/wiki/File:Mimosa pudica leaves folding when touched\\_3.ogv](http://commons.wikimedia.org/wiki/File:Mimosa_pudica_leaves_folding_when_touched_3.ogv)

- Although no two look alike, these kittens have inherited genes from both parents and share many of the same characteristics. (Credit: Pieter & Renée Lanser)

- Later in this course, you will learn about meiosis and how parental DNA is “mixed” so offspring are unique.

- Polar bears and other mammals living in ice-covered regions maintain their body temperature by generating heat and reducing heat loss by means of thick fur and a dense layer of fat under their skin. (Credit: “longhorndave”/Flickr)
- **Think of the biological ways humans regulate body temperature.**

# Other Homeostatic Mechanisms

- Blood pH is tightly regulated.
- Pancreatic hormones work to regulate blood glucose.

- A lot of energy is required for a California condor to fly. Chemical energy derived from food is used to power flight. California condors are an endangered species; scientists have strived to place a wing tag on each bird to help them identify and locate each individual bird. (Credit: Pacific Southwest Region U.S. Fish and Wildlife)

- To understand energy processing in organisms like humans we will cover the key energy processing organelles:
- mitochondria.
- chloroplasts.

- A molecule, like this large DNA molecule, is composed of atoms. (Credit: “Brian0918”/Wikimedia Commons)

# CONCEPT IN ACTION

- To see an animation of this DNA molecule, click [here](#)
- [http://openstaxcollege.org/l/rotating\\_DNA2](http://openstaxcollege.org/l/rotating_DNA2)

- You will learn the basics of how DNA stores information to make proteins and how genes (traits) are inherited.

**Atom:** A basic unit of matter that consists of a dense central nucleus surrounded by a cloud of negatively charged electrons.

**Molecule:** A phospholipid, composed of many atoms.

**Organelles:** Structures that perform functions within a cell. Highlighted in blue are a Golgi apparatus and a nucleus.

**Cells:** Human blood cells.

**Tissue:** Human skin tissue.

**Organs and organ systems:** Organs such as the stomach and intestine make up part of the human digestive system.

**Organisms, populations, and communities:** In a park, each person is an organism. Together, all the people make up a population. All the plant and animal species in the park comprise a community.

**Ecosystem:** The ecosystem of Central Park in New York includes living organisms and the environment in which they live.

**The biosphere:** Encompasses all the ecosystems on Earth.

<b>DOMAIN</b> <b>Eukarya</b>	Dog	Wolf	Coyote	Fox	Lion	Seal	Mouse	Human	Whale	Bat	Fish	Snake	Earthworm	Moth	Paramecium	Tree
<b>KINGDOM</b> <b>Animalia</b>	Dog	Wolf	Coyote	Fox	Lion	Seal	Mouse	Human	Whale	Bat	Fish	Snake	Earthworm	Moth		
<b>PHYLUM</b> <b>Chordata</b>	Dog	Wolf	Coyote	Fox	Lion	Seal	Mouse	Human	Whale	Bat	Fish	Snake				
<b>CLASS</b> <b>Mammalia</b>	Dog	Wolf	Coyote	Fox	Lion	Seal	Mouse	Human	Whale	Bat						
<b>ORDER</b> <b>Carnivora</b>	Dog	Wolf	Coyote	Fox	Lion	Seal										
<b>FAMILY</b> <b>Canidae</b>	Dog	Wolf	Coyote	Fox												
<b>GENUS</b> <b>Canis</b>	Dog	Wolf	Coyote													
<b>SPECIES</b> <b><i>Canis lupus</i></b>	Dog	Wolf														

- This diagram shows the levels of taxonomic hierarchy for a dog, from the broadest category—domain—to the most specific—species.

- Create a mnemonic device to remember the taxonomic hierarchy:  
K P C O F G S

- Do you know the scientific name of other organisms?
- Homo sapien
- Drosophila melanogaster

(a)

(b)

(c)

(d)

- These images represent different domains. The scanning electron micrograph shows (a) bacterial cells belong to the domain Bacteria, while the (b) extremophiles, seen all together as colored mats in this hot spring, belong to domain Archaea. Both the (c) sunflower and (d) lion are part of domain Eukarya. (Credit a: modification of work by Rocky Mountain Laboratories, NIAID, NIH; credit b: modification of work by Steve Jurvetson; credit c: modification of work by Michael Arrighi; credit d: modification of work by Frank Vassen)

- This phylogenetic tree was constructed by microbiologist Carl Woese using genetic relationships. The tree shows the separation of living organisms into three domains: Bacteria, Archaea, and Eukarya. Bacteria and Archaea are organisms without a nucleus or other organelles surrounded by a membrane and, therefore, are prokaryotes. (Credit: modification of work by Eric Gaba)

- Researchers work on excavating dinosaur fossils at a site in Castellón, Spain. (Credit: Mario Modesto)

- This forensic scientist works in a DNA extraction room at the U.S. Army Criminal Investigation Laboratory. (Credit: U.S. Army CID Command Public Affairs)

(a)

(b)

- Formerly called blue-green algae, the (a) cyanobacteria seen through a light microscope are some of Earth's oldest life forms. These (b) stromatolites along the shores of Lake Thetis in Western Australia are ancient structures formed by the layering of cyanobacteria in shallow waters. (Credit a: modification of work by NASA; scale-bar data from Matt Russell; credit b: modification of work by Ruth Ellison)

- Biologists may choose to study *Escherichia coli* (*E. coli*), a bacterium that is a normal resident of our digestive tracts but is also sometimes responsible for disease outbreaks. In this micrograph, the bacterium is visualized using a scanning electron microscope and digital colorization. (Credit: Eric Erbe; digital colorization by Christopher Pooley, USDA-ARS)

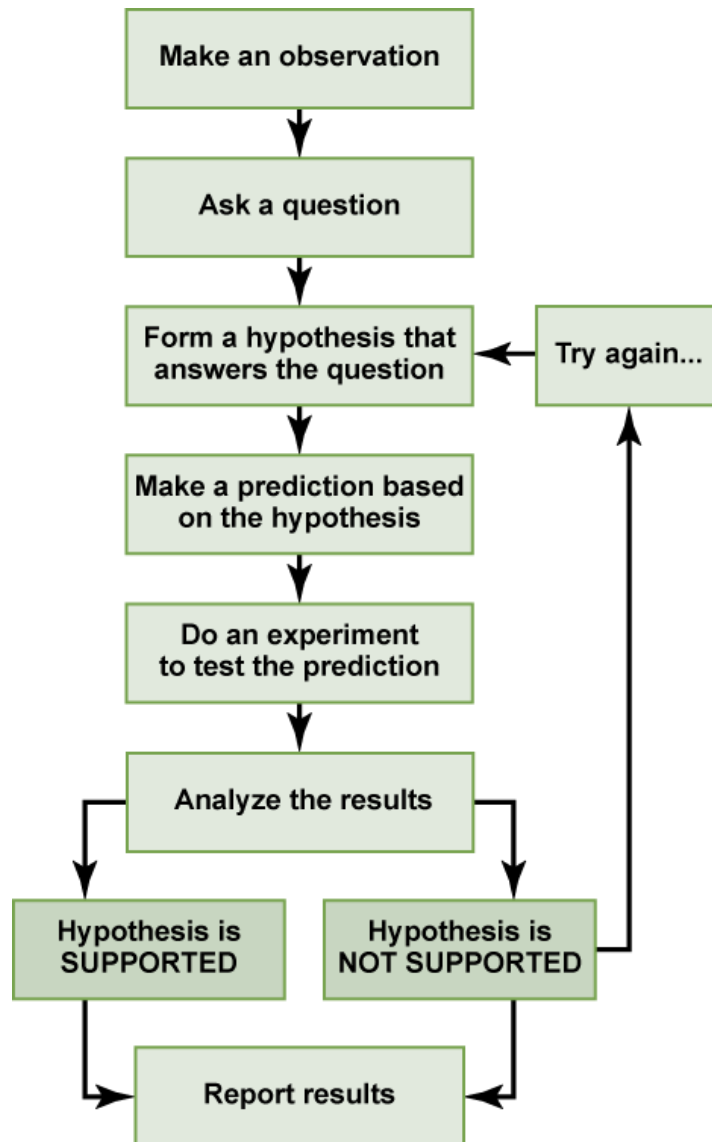

- Some fields of science include astronomy, biology, computer science, geology, logic, physics, chemistry, and mathematics. (Credit: “Image Editor”/Flickr)

- Sir Francis Bacon is credited with being the first to document the scientific method.

- The scientific method is a series of defined steps that include experiments and careful observation. If a hypothesis is not supported by data, a new hypothesis can be proposed.
- Distinguishing between theory and hypothesis.

- The Human Genome Project was a 13-year collaborative effort among researchers working in several different fields of science. The project was completed in 2003. (Credit: the U.S. Department of Energy Genome Programs)
